Ergodic theory

Let
$$(X, \mathcal{B}, \mu)$$
 be a probability space and let
 $T : (X, \mathcal{B}, \mu) \rightarrow (X, \mathcal{B}, \mu)$ be a measurable map.

Definition

- (a) T is called a measure-preserving transformation if $\mu(T^{-1}(A)) = \mu(A)$ for all $A \in \mathcal{B}$.
- (b) *T* is called **ergodic** if it is measure-preserving and satisfies one of the following equivalent conditions:
 - (i) Given any measurable sets A, B with positive measures, one can find an integer $n \ge 0$ such that $T^n(A) \cap B \ne \emptyset$;
 - (ii) if $A \in \mathcal{B}$ satisfies $T(A) \subset A$, then $\mu(A) = 0$ or 1.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

Example - Irrational rotations

Let $X = \mathbb{T}$, let \mathcal{B} be the Borel σ -algebra on \mathbb{T} and let μ be the Lebesgue measure on \mathbb{T} . Let $\theta \in \mathbb{R} \setminus \mathbb{Q}$. Then

$$egin{array}{rcl} T:(X,\mathcal{B},\mu)&
ightarrow&(X,\mathcal{B},\mu)\ &&z&\mapsto&e^{i2\pi heta}z \end{array}$$

is ergodic.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Example - Dyadic transformation

Let X = [0, 1), let \mathcal{B} be the Borel σ -algebra on X and let μ be the Lebesgue measure on X. Then

$$egin{array}{rcl} \mathcal{T}:(\mathcal{X},\mathcal{B},\mu)&
ightarrow&(\mathcal{X},\mathcal{B},\mu)\ &x&\mapsto&2x\mod1 \end{array}$$

is ergodic.

Example - Bernoulli shift

Let $X = \{-1,1\}^{\mathbb{Z}}$, let \mathcal{B} be the σ -algebra generated by cylinder sets:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Example - Bernoulli shift

Let $X = \{-1,1\}^{\mathbb{Z}}$, let \mathcal{B} be the σ -algebra generated by cylinder sets:

$$\{x \in X; (x_n, \ldots, x_p) \in E_n \times \cdots \times E_p\}, E_j \subset \{-1, 1\}.$$

Example - Bernoulli shift

Let $X = \{-1,1\}^{\mathbb{Z}}$, let \mathcal{B} be the σ -algebra generated by cylinder sets:

$$\{x \in X; (x_n, \ldots, x_p) \in E_n \times \cdots \times E_p\}, E_j \subset \{-1, 1\}.$$

 μ_k is defined by $\mu_k(\{1\}) = 1/2$ and $\mu_k(\{-1\}) = 1/2$. Let $\mu = \cdots \otimes \mu_{-1} \otimes \mu_0 \otimes \mu_1 \otimes \ldots$, namely

$$\mu(\{x \in X; (x_n, \ldots, x_p) \in E_n \times \cdots \times E_p\}) = \mu_n(E_n) \times \cdots \times \mu_p(E_p).$$

Then

$$egin{array}{rcl} \mathcal{T}: (\mathcal{X}, \mathcal{B}, \mu) & o & (\mathcal{X}, \mathcal{B}, \mu) \ & (x_n) & \mapsto & (x_{n+1}) \end{array}$$

is ergodic.

Why?

STRATEGY: Let $T \in \mathfrak{L}(X)$. Suppose that we can construct a measure μ defined on the Borel σ -algebra \mathcal{B} of X, such that

- μ has full support (namely μ(U) > 0 for any non-empty open set U ⊂ X);
- T is ergodic with respect to µ (namely µ(A)µ(B) ≠ 0 implies that there exists n ∈ N with Tⁿ(A) ∩ B ≠ Ø.)

Then T is topologically transitive, hence hypercyclic.

Introduction

Birkhoff's ergodic theorem

Theorem

Let (X, \mathcal{B}, μ) be a probability space and let $T : (X, \mathcal{B}, \mu) \rightarrow (X, \mathcal{B}, \mu)$ be a measure-preserving ergodic transformation. For any $f \in L^1(X, \mu)$,

$$\frac{1}{N}\sum_{n=0}^{N-1}f(T^nx)\xrightarrow{N\to\infty}\int_X fd\mu \quad \mu\text{-a.e.}$$

Birkhoff's ergodic theorem

Theorem

Let (X, \mathcal{B}, μ) be a probability space and let $T : (X, \mathcal{B}, \mu) \rightarrow (X, \mathcal{B}, \mu)$ be a measure-preserving ergodic transformation. For any $f \in L^1(X, \mu)$,

$$\frac{1}{N}\sum_{n=0}^{N-1}f(T^nx)\xrightarrow{N\to\infty}\int_X fd\mu \quad \mu\text{-a.e.}$$

Corollary

Let $T \in \mathfrak{L}(X)$. Assume that T is an ergodic transformation with respect to a Borel probability measure μ on X with full support. Then μ -almost every point $x \in X$ has the following property: for every non-empty open set $V \subset X$, one has

$$\liminf_{N\to\infty}\frac{\operatorname{card}\left\{n\in[0,N);\ T^n(x)\in V\right\}}{N}>0.$$

Thus, if we can construct a probability measure μ defined on the Borel σ -algebra \mathcal{B} of X, such that

- µ has full support (namely µ(U) > 0 for any non-empty open set U ⊂ X);
- T is ergodic with respect to μ .

Then μ -almost every point $x \in X$ has the following property: for every non-empty open set $V \subset X$, one has

$$\liminf_{N\to\infty} \frac{\operatorname{card} \left\{ n \in [0, N); \ T^n(x) \in V \right\}}{N} > 0.$$
 (1)

Thus, if we can construct a probability measure μ defined on the Borel σ -algebra \mathcal{B} of X, such that

- µ has full support (namely µ(U) > 0 for any non-empty open set U ⊂ X);
- *T* is ergodic with respect to μ .

Then μ -almost every point $x \in X$ has the following property: for every non-empty open set $V \subset X$, one has

$$\liminf_{N\to\infty} \frac{\operatorname{card} \left\{ n \in [0, N); \ T^n(x) \in V \right\}}{N} > 0.$$
 (1)

Hypercyclic operators satisfying the stronger condition (1) are called **frequently hypercyclic**. Moreover, we get that the set of (frequently) hypercyclic vectors is large in a probabilistic sense.

Questions to solve

• What kind of measures shall we consider?

Real Gaussian variables

For any $\sigma > 0$, let us denote by γ_{σ} the centered Gaussian measure on \mathbb{R} with variance σ^2 ; that is,

$$d\gamma_\sigma = rac{1}{\sigma\sqrt{2\pi}}\,e^{-rac{t^2}{2\sigma^2}}\,dt\,.$$

Real Gaussian variables

For any $\sigma>0$, let us denote by γ_{σ} the centered Gaussian measure on $\mathbb R$ with variance σ^2 ; that is,

$$d\gamma_{\sigma} = rac{1}{\sigma\sqrt{2\pi}} \, e^{-rac{t^2}{2\sigma^2}} \, dt \, .$$

 $\left. \begin{array}{l} X_1 \sim \gamma_{\sigma_1} \\ X_2 \sim \gamma_{\sigma_2} \\ X_1 \mbox{ and } X_2 \mbox{ are independent } \end{array} \right\} \implies X_1 + X_2 \sim \gamma_{\sigma} \mbox{ with } \sigma^2 = \sigma_1^2 + \sigma_2^2.$

Real Gaussian variables

For any $\sigma > 0$, let us denote by γ_{σ} the centered Gaussian measure on \mathbb{R} with variance σ^2 ; that is,

$$d\gamma_{\sigma} = rac{1}{\sigma\sqrt{2\pi}} e^{-rac{t^2}{2\sigma^2}} dt$$
 .

 $\left. \begin{array}{l} X_1 \sim \gamma_{\sigma_1} \\ X_2 \sim \gamma_{\sigma_2} \\ X_1 \mbox{ and } X_2 \mbox{ are independent } \end{array} \right\} \implies X_1 + X_2 \sim \gamma_{\sigma} \mbox{ with } \sigma^2 = \sigma_1^2 + \sigma_2^2.$

If (X_n) are independent random variables, $X_n \sim \gamma_{\sigma_n}$ and if $\sum_n \sigma_n^2 < +\infty$, then $\sum_n X_n \sim \gamma_{\sigma}$ with $\sigma^2 = \sum_n \sigma_n^2$.

Complex Gaussian variables

Definition

A complex-valued random variable $Z : \Omega \to \mathbb{C}$ defined on some probability space $(\Omega, \mathcal{F}, \mathbb{P})$ is said to have **complex symmetric Gaussian distribution** if either Z is almost surely 0, or the real and imaginary parts of Z are independent and have centered Gaussian distribution with the same variance.

Complex Gaussian variables

Definition

A complex-valued random variable $Z : \Omega \to \mathbb{C}$ defined on some probability space $(\Omega, \mathcal{F}, \mathbb{P})$ is said to have **complex symmetric Gaussian distribution** if either Z is almost surely 0, or the real and imaginary parts of Z are independent and have centered Gaussian distribution with the same variance.

Remark

Let Z be a complex random variable with complex Gaussian distribution, $\mathbb{E}(|Z|^2) = \sigma^2$, and write it Z = X + iY. Then $\mathbb{E}(|X|^2) = \sigma^2/2$ and $\mathbb{E}(|Y|^2) = \sigma^2/2$. If $\mathbb{E}|Z|^2 = 1$, then Z is said to be **standard**.

Complex Gaussian variables

Definition

Gaussian measures

Definition

A **Gaussian measure** on X is a probability measure μ on X such that each continuous linear functional $x^* \in X^*$ has symmetric complex Gaussian distribution, when considered as a random variable on (X, \mathcal{B}, μ) .

Gaussian measures

Definition

A **Gaussian measure** on X is a probability measure μ on X such that each continuous linear functional $x^* \in X^*$ has symmetric complex Gaussian distribution, when considered as a random variable on (X, \mathcal{B}, μ) .

Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space, and let $(g_n)_{n \in \mathbb{N}}$ be a sequence of independent standard complex Gaussian variables defined on $(\Omega, \mathcal{F}, \mathbb{P})$. Such a sequence (g_n) will be called a **standard Gaussian sequence**.

Gaussian measures

Definition

A **Gaussian sum** in X is a sum $\sum_{n} g_n x_n$ where (x_n) is a sequence of vectors in X.

Convergence of Gaussian sums

Proposition

- Let $(x_n) \subset X$. The following are equivalent :
 - (i) The Gaussian sum $\sum_{n} g_n x_n$ converges almost surely.
 - (ii) The Gaussian sum $\sum_{n} g_n x_n$ converges in L^p , for some $p \in [1, +\infty)$;
- (iii) The Gaussian sum $\sum_{n} g_n x_n$ converges in L^p , for any $p \in [1, +\infty)$;
- (iv) The Gaussian sum $\sum_{n} g_n x_n$ converges in probability.
- If X is a Hilbert space, this is equivalent to $\sum_n ||x_n||^2 < +\infty$.

The covariance operator

Gaussian variables on $\ensuremath{\mathbb{R}}$ are characterized by their mean and their variance.

Gaussian vectors on \mathbb{R}^d are characterized by their mean and their covariance matrix.

The covariance operator

Gaussian variables on $\ensuremath{\mathbb{R}}$ are characterized by their mean and their variance.

Gaussian vectors on \mathbb{R}^d are characterized by their mean and their covariance matrix.

Theorem

Let μ be a Gaussian measure on X.

(1) One can define a continuous, conjugate-linear operator $R_{\mu}: X^* \to X$ such that, for every $(x^*, y^*) \in X^* \times X^*$:

$$\langle R_{\mu}(x^*), y^*
angle = \int_X \overline{\langle x^*, z
angle} \langle y^*, z
angle \, d\mu(z) = \langle x^*, y^*
angle_{L^2(\mu)}.$$

The operator R_{μ} is called the **covariance operator** of μ . (2) Two Gaussian measures on X coincide if and only if they have the same covariance operator.

There exists some separable Hilbert space ${\mathcal H}$ and an operator $K:{\mathcal H}\to X$ such that

$$R_{\mu} = KK^*.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Covariance operator and properties of μ

$$\langle R_{\mu}(x^*), y^* \rangle = \int_X \overline{\langle x^*, z \rangle} \langle y^*, z \rangle \, d\mu(z) = \langle x^*, y^* \rangle_{L^2(\mu)}.$$

It characterizes the Gaussian measure $\mu:$ one can see any property of μ on it.

Covariance operator and properties of μ

$$\langle R_{\mu}(x^*), y^* \rangle = \int_X \overline{\langle x^*, z \rangle} \langle y^*, z \rangle \, d\mu(z) = \langle x^*, y^* \rangle_{L^2(\mu)}.$$

It characterizes the Gaussian measure μ : one can see any property of μ on it. How to see on R (or on K) that μ has full support?

Covariance operator and properties of μ

$$\langle R_{\mu}(x^*), y^* \rangle = \int_X \overline{\langle x^*, z \rangle} \langle y^*, z \rangle \, d\mu(z) = \langle x^*, y^* \rangle_{L^2(\mu)}.$$

It characterizes the Gaussian measure μ : one can see any property of μ on it. How to see on R (or on K) that μ has full support?

Theorem

Let μ be a Gaussian measure and let $R = KK^*$ be its covariance operator. Then the following properties are equivalent :

- (i) μ has full support;
- (ii) *R* is one-to-one;
- (iii) K has dense range.

Covariance operator and properties of μ

$$\langle R_{\mu}(x^*), y^* \rangle = \int_X \overline{\langle x^*, z \rangle} \langle y^*, z \rangle \, d\mu(z) = \langle x^*, y^* \rangle_{L^2(\mu)}.$$

It characterizes the Gaussian measure μ : one can see any property of μ on it. How to see on R (or on K) that μ has full support?

Theorem

Let μ be a Gaussian measure and let $R = KK^*$ be its covariance operator. Then the following properties are equivalent :

- (i) μ has full support;
- (ii) *R* is one-to-one;
- (iii) K has dense range.

The difficult implication: (*iii*) \implies (*i*).

Gaussian measures with full support

K has dense range $\implies \mu$ has full support.

Step 1 The support of a Gaussian sum.

Let $\sum_{n} g_n x_n$ be an almost surely convergent Gaussian sum and let ν be its distribution. Let $O \subset X$ be open such that $O \cap \operatorname{span}(x_n) \neq \emptyset$. Then $\nu(O) > 0$.

Gaussian measures with full support

K has dense range $\implies \mu$ has full support.

Step 1 The support of a Gaussian sum.

Let $\sum_{n} g_n x_n$ be an almost surely convergent Gaussian sum and let ν be its distribution. Let $O \subset X$ be open such that $O \cap \operatorname{span}(x_n) \neq \emptyset$. Then $\nu(O) > 0$.

The support of the distribution of a Gaussian sum $\sum_{n} g_n x_n$ is the closure of $\operatorname{span}(x_n)$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Gaussian measures with full support

Step 2 The covariance operator of a Gaussian sum.

1

Let $\sum_{n} g_n x_n$ be an almost surely convergent Gaussian sum and let ν be its distribution. Then the covariance operator of ν is given by

$$\mathsf{R}_{\nu}(x^*) = \sum_{n} \overline{\langle x^*, x_n \rangle} \, x_n.$$

Gaussian measures with full support

Step 2 The covariance operator of a Gaussian sum.

Let $\sum_{n} g_n x_n$ be an almost surely convergent Gaussian sum and let ν be its distribution. Then the covariance operator of ν is given by

$$R_{\nu}(x^*) = \sum_n \overline{\langle x^*, x_n \rangle} x_n.$$

$$\begin{array}{lll} \langle R_{\nu}(x^{*}), y^{*} \rangle &=& \int_{X} \overline{\langle x^{*}, x \rangle} \langle y^{*}, x \rangle d\nu(x) \\ &=& \int_{\Omega} \overline{\langle x^{*}, \sum_{n} g_{n}(\omega) x_{n} \rangle} \left\langle y^{*}, \sum_{n} g_{n}(\omega) x_{n} \right\rangle d\mathbb{P}(\omega) \\ &=& \sum_{n,m} \overline{\langle x^{*}, x_{n} \rangle} \langle y^{*}, x_{m} \rangle \int_{\Omega} \overline{g_{n}(\omega)} g_{m}(\omega) d\mathbb{P}(\omega) \\ &=& \sum_{n} \overline{\langle x^{*}, x_{n} \rangle} \langle y^{*}, x_{n} \rangle \end{array}$$

Gaussian measures with full support

Step 3 Any Gaussian measure is the distribution of a Gaussian sum

Let $R = KK^*$ be the covariance operator of some Gaussian measure μ . Then, for any orthonormal basis (e_n) of \mathcal{H} ,

$$Rx^* = \sum_n \overline{\langle x^*, Ke_n \rangle} Ke_n.$$

Gaussian measures with full support

Step 3 Any Gaussian measure is the distribution of a Gaussian sum

Let $R = KK^*$ be the covariance operator of some Gaussian measure μ . Then, for any orthonormal basis (e_n) of \mathcal{H} ,

$$Rx^* = \sum_n \overline{\langle x^*, Ke_n \rangle} Ke_n.$$

$$R(x^*) = K\left(\sum_{n=0}^{\infty} \langle e_n, K^*(x^*) \rangle_{\mathcal{H}} e_n\right)$$
$$= \sum_{n=0}^{\infty} \overline{\langle x^*, K(e_n) \rangle} K(e_n),$$

Gaussian measures with full support

K has dense range $\implies \mu$ has full support.

- Step 1 Let $\sum_{n} g_n x_n$ be an almost surely convergent Gaussian sum and let ν be its distribution. Let $O \subset X$ be open such that $O \cap \operatorname{span}(x_n) \neq \emptyset$. Then $\nu(O) > 0$.
- Step 2 Let $\sum_{n} g_n x_n$ be an almost surely convergent Gaussian sum and let ν be its distribution. Then the covariance operator of ν is given by

$$R_{\nu}(x^*) = \sum_n \overline{\langle x^*, x_n \rangle} \, x_n.$$

Step 3 Let $R = KK^*$ be the covariance operator of some Gaussian measure μ . Then, for any orthonormal basis (e_n) of \mathcal{H} ,

$$Rx^* = \sum_n \overline{\langle x^*, Ke_n \rangle} Ke_n.$$

Weakly mixing - Strongly mixing

 $T: (X, \mathcal{B}, \mu) \rightarrow (X, \mathcal{B}, \mu)$ is weakly mixing

$$\iff \lim_{N\to\infty}\frac{1}{N}\sum_{n=0}^{N-1}|\mu(A\cap T^{-n}(B))-\mu(A)\mu(B)|=0 \ (A,B\in\mathcal{B})$$

$$\iff \lim_{N\to\infty}\frac{1}{N}\sum_{n=0}^{N-1}\left|\int_X f(T^n z)g(z)\,d\mu(z)-\int_X fd\mu\int_X gd\mu\right|=0.$$

 $\mathcal{T}: (\mathcal{X}, \mathcal{B}, \mu)
ightarrow (\mathcal{X}, \mathcal{B}, \mu)$ is strongly mixing

$$\iff \lim_{n\to\infty}\mu(A\cap T^{-n}(B))=\mu(A)\mu(B) \ (A,B\in\mathcal{B})$$

$$\iff \lim_{n\to\infty}\int_X f(T^n z)g(z)\,d\mu(z) = \int_X f\,d\mu\,\int_X g\,d\mu\,\big(f,g\in L^2(X,\mu)\big).$$

The characterization of mixing properties

Theorem (Rudnicki, 1993)

Let μ be a Gaussian measure on X with full support and covariance operator R. Let $T \in \mathfrak{L}(X)$ be measure-preserving. The following are equivalent:

 (i) T is weakly mixing (strongly mixing, respectively) with respect to μ;

(ii) For all
$$x^*, y^* \in X^*$$
,

$$\lim_{N\to\infty}\frac{1}{N}\sum_{n=0}^{N-1}|\langle RT^{*n}(x^*),y^*\rangle|=0$$

$$(\lim_{n\to\infty} \langle RT^{*n}(x^*), y^* \rangle = 0, \text{ respectively}).$$

The difficult implication - I

Assumption:

$$\lim_{n\to\infty} \langle RT^{*n}(x^*), y^* \rangle = 0 \ (x^*, y^*) \in X^*.$$

Conclusion:

$$\lim_{n\to\infty}\mu(A\cap T^{-n}(B))=\mu(A)\mu(B)\ (A,B\in\mathcal{B}).$$
 (2)

The difficult implication - I

Assumption:

$$\lim_{n\to\infty} \langle RT^{*n}(x^*), y^* \rangle = 0 \ (x^*, y^*) \in X^*.$$

Conclusion:

$$\lim_{n\to\infty}\mu(A\cap T^{-n}(B))=\mu(A)\mu(B)\ (A,B\in\mathcal{B}).$$
 (2)

Definition

 $A \subset X$ is a **cylinder set** if there exist $N \ge 1$, (x_1^*, \ldots, x_N^*) a family of independent vectors of X^* and $E \subset \mathbb{C}^N$ such that

$$A = \left\{ x \in X; \ \left(\langle x_1^*, x \rangle, \dots, \langle x_N^*, x \rangle \right) \in E \right\}.$$

The difficult implication - I

Assumption:

$$\lim_{n\to\infty} \langle RT^{*n}(x^*), y^* \rangle = 0 \ (x^*, y^*) \in X^*.$$

Conclusion:

$$\lim_{n\to\infty}\mu(A\cap T^{-n}(B))=\mu(A)\mu(B)\ (A,B\in\mathcal{B}).$$
 (2)

Definition

 $A \subset X$ is a **cylinder set** if there exist $N \ge 1$, (x_1^*, \ldots, x_N^*) a family of independent vectors of X^* and $E \subset \mathbb{C}^N$ such that

$$A = \left\{ x \in X; \ \left(\langle x_1^*, x \rangle, \dots, \langle x_N^*, x \rangle \right) \in E \right\}.$$

It suffices to testify (2) for A, B cylinder sets.

The difficult implication - II

Definition

 $A \subset X$ is a **cylinder set** if there exist $N \ge 1$, (x_1^*, \ldots, x_N^*) a family of independent vectors of X^* and $E \subset \mathbb{C}^N$ such that

$$A = \left\{ x \in X; \ \left(\langle x_1^*, x \rangle, \dots, \langle x_N^*, x \rangle \right) \in E \right\}.$$

Cylinder sets are "finite-dimensional sets"

The difficult implication - II

Definition

 $A \subset X$ is a **cylinder set** if there exist $N \ge 1$, (x_1^*, \ldots, x_N^*) a family of independent vectors of X^* and $E \subset \mathbb{C}^N$ such that

$$A = \left\{ x \in X; \ \left(\langle x_1^*, x \rangle, \dots, \langle x_N^*, x \rangle \right) \in E \right\}.$$

Cylinder sets are "finite-dimensional sets" \implies we need a finite-dimensional lemma.

Lemma

Let (ν_n) be a sequence of Gaussian measures on some finite-dimensional Banach space $E = \mathbb{C}^N$, and let ν be a Gaussian measure on E with full support. Assume that $R_{\nu_n} \to R_{\nu}$ as $n \to \infty$. Then $\nu_n(Q) \to \nu(Q)$ for every Borel set $Q \subset E$.

The difficult implication - III

Assumption:

$$\lim_{n\to\infty} \langle RT^{*n}(x^*), y^* \rangle = 0 \ (x^*, y^*) \in X^*.$$

$$\begin{aligned} A &= \left\{ x \in X; \ \left(\langle x_1^*, x \rangle, \dots, \langle x_N^*, x \rangle \right) \in E \right\} \\ B &= \left\{ x \in X; \ \left(\langle y_1^*, x \rangle, \dots, \langle y_M^*, x \rangle \right) \in F \right\}. \end{aligned}$$

Aim :

$$\lim_{n\to\infty}\mu(A\cap T^{-n}(B))=\mu(A)\mu(B).$$

Tool :

Lemma

Let (ν_n) be a sequence of Gaussian measures on some finite-dimensional Banach space $E = \mathbb{C}^N$, and let ν be a Gaussian measure on E with full support. Assume that $R_{\nu_n} \to R_{\nu}$ as $n \to \infty$. Then $\nu_n(Q) \to \nu(Q)$ for every Borel set $Q \subset E$.

Having sufficiently many \mathbb{T} -eigenvectors

Definition

A vector $x \in X$ is a **T**-eigenvector for T if $T(x) = \lambda x$ for some $\lambda \in \mathbb{T}$.

Having sufficiently many $\mathbb{T}\text{-eigenvectors}$

Definition

A vector $x \in X$ is a **T**-eigenvector for T if $T(x) = \lambda x$ for some $\lambda \in \mathbb{T}$.

Definition

A map $E : \mathbb{T} \to X$ is a **perfectly spanning** \mathbb{T} -eigenvector field provided

(i)
$$E \in L^{\infty}(\mathbb{T}, X)$$
;

(ii) $\forall \lambda \in \mathbb{T}, \ TE(\lambda) = \lambda E(\lambda);$

(iii) For any $A \subset \mathbb{T}$ with m(A) = 0, then span $(E(\lambda); \lambda \in A)$ is dense in A.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

The operator K_E

Let $T \in \mathfrak{L}(X)$ with a perfectly spanning \mathbb{T} -eigenvector field E. Define

$$\mathcal{K}_E: L^2(\mathbb{T}, dm) \rightarrow X$$

 $f \mapsto \int_{\mathbb{T}} f(\lambda) E(\lambda) dm(\lambda)$

and $R = K_E K_E^*$. Then

- 1. K_E has dense range;
- 2. $TRT^* = T$;
- 3. For any $x^*, y^* \in X^*$, $\langle RT^{*n}(x^*), y^* \rangle \to 0$.

On a Hilbert space

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges almost surely.

Fact. On a Hilbert space, a Gaussian sum $\sum_n g_n x_n$ converges almost surely if and only if $\sum_n ||x_n||^2 < +\infty$.

On a Hilbert space

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges almost surely.

Fact. On a Hilbert space, a Gaussian sum $\sum_n g_n x_n$ converges almost surely if and only if $\sum_n ||x_n||^2 < +\infty$.

On a Hilbert space, γ -radonifying operators and Hilbert-Schmidt operators coincide!

On a Hilbert space

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges almost surely.

Fact. On a Hilbert space, a Gaussian sum $\sum_n g_n x_n$ converges almost surely if and only if $\sum_n ||x_n||^2 < +\infty$.

On a Hilbert space, γ -radonifying operators and Hilbert-Schmidt operators coincide!

$$\begin{array}{rcl} \mathcal{K}_{E}: L^{2}(\mathbb{T}, dm) & \to & X \\ f & \mapsto & \int_{\mathbb{T}} f(\lambda) E(\lambda) dm(\lambda) \end{array}$$

On a Hilbert space

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges almost surely.

Fact. On a Hilbert space, a Gaussian sum $\sum_n g_n x_n$ converges almost surely if and only if $\sum_n ||x_n||^2 < +\infty$.

On a Hilbert space, γ -radonifying operators and Hilbert-Schmidt operators coincide!

$$\mathcal{K}_E: L^2(\mathbb{T}, dm) \rightarrow X$$

 $f \mapsto \int_{\mathbb{T}} f(\lambda) E(\lambda) dm(\lambda)$

It is Hilbert-Schmidt! $R = K_E K_E^*$ is the covariance operator of some Gaussian measure!

Theorem on a Hilbert space

Theorem (B. Grivaux (2006))

Let X be a separable Hilbert space and let $T \in \mathfrak{L}(X)$ be such that T has a perfectly spanning \mathbb{T} -eigenvectorfield. Then there exists a Gaussian measure μ on X with full support, with respect to which T is a strongly-mixing measure-preserving transformation.

What about Banach spaces?

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges almost surely.

What about Banach spaces?

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges in $L^2(\Omega, X)$.

What about Banach spaces?

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges in $L^2(\Omega, X)$.

Definition

A Banach space X is said to have (Gaussian) type $p \in [1,2]$ if

$$\left\|\sum_{n}g_{n}x_{n}\right\|_{L^{2}(\Omega,X)}\leq C\left(\sum_{n}||x_{n}||^{p}\right)^{\frac{1}{p}}$$

for some finite constant C and every finite sequence $(x_n) \subset X$.

What about Banach spaces?

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges in $L^2(\Omega, X)$.

Definition

A Banach space X is said to have (Gaussian) type $p \in [1,2]$ if

$$\left\|\sum_{n}g_{n}x_{n}\right\|_{L^{2}(\Omega,X)}\leq C\left(\sum_{n}||x_{n}||^{p}\right)^{\frac{1}{p}},$$

for some finite constant C and every finite sequence $(x_n) \subset X$.

- A Hilbert space has type 2;
- L^p-spaces have type min(p, 2);
- Any Banach space has type 1;

What about Banach spaces?

 $K \in \mathfrak{L}(\mathcal{H}, X)$ is γ -radonifying if for some orthonormal basis (e_n) of \mathcal{H} , the Gaussian series $\sum g_n(\omega)K(e_n)$ converges in $L^2(\Omega, X)$.

Definition

A Banach space X is said to have (Gaussian) type $p \in [1,2]$ if

$$\left\|\sum_{n}g_{n}x_{n}\right\|_{L^{2}(\Omega,X)}\leq C\left(\sum_{n}||x_{n}||^{p}\right)^{\frac{1}{p}}$$

for some finite constant C and every finite sequence $(x_n) \subset X$.

Corollary

Let X be a Banach space with type p and let $K \in \mathfrak{L}(\mathcal{H}, X)$. Then K is γ -radonifying as soon as $\sum_{n} ||Ke_{n}||^{p} < +\infty$ for some orthonormal basis (e_{n}) of \mathcal{H} .

What about Banach spaces?

Theorem (B. Matheron, 2009)

Let X be a separable Banach space and let $T \in \mathfrak{L}(X)$ be such that T has a perfectly spanning \mathbb{T} -eigenvector field E. Suppose moreover that :

- X has type p;
- E is α -Hölderian for some $\alpha > \frac{1}{p} \frac{1}{2}$.

Then there exists a Gaussian measure μ on X with full support, with respect to which T is a strongly-mixing measure-preserving transformation.

What about Banach spaces?

Theorem (B. Matheron, 2009)

Let X be a separable Banach space and let $T \in \mathfrak{L}(X)$ be such that T has a perfectly spanning \mathbb{T} -eigenvector field E. Suppose moreover that :

and u(s) is a T-eigenvector with eigenvalue $\phi(s)$.

Prove that everything remains true with K_E : L²(T, dσ) → X instead of K_E : L²(T, dm) → X.

In fact, we will have to consider several such maps instead of one!

The construction of Cantor sets

Lemma

Let $T \in \mathcal{L}(X)$ with a perfectly spanning \mathbb{T} -eigenvector field. Let also (ε_n) be a sequence of positive real numbers. There exist a sequence (C_i) of subsets of \mathbb{T} , a sequence of homeomorphisms (ϕ_i) from $\{-1,1\}^{\mathbb{N}}$ onto \mathcal{C}_i and a sequence of continuous functions $(u_i), u_i : \{-1, 1\}^{\mathbb{N}} \to S_X$ such that, setting $E_i = u_i \circ \phi_i^{-1}$, (a) for any $i \geq 1$ and any $\lambda \in C_i$, $TE_i(\lambda) = \lambda E_i(\lambda)$; (b) $span(E_i(\lambda); i \ge 1, \lambda \in C_i)$ is dense in X; (c) for any $n \ge 1$, any $(s_1, \ldots, s_{n-1}) \in \{-1, 1\}^{n-1}$, any $s', s'' \in \{-1, 1\}^{\mathbb{N}}$.

$$\|u_i(s_1,\ldots,s_{n-1},1,s')-u_i(s_1,\ldots,s_{n-1},-1,s'')\|\leq \varepsilon_n.$$

How to prove this?

Step 1 Since *E* has a perfectly spanning \mathbb{T} -eigenvector field, there exists a sequence (x_i) satisfying :

- each x_i belongs to S_X, is a T-eigenvector and the corresponding eigenvalues (λ_i) are all different;
- each x_i is a limit of a subsequence $(x_{n_k})_{k\geq 1}$;
- $\operatorname{span}(x_i; i \ge 1)$ is dense in X.

How to prove this?

Proof of the main result

We apply the previous lemma with $\varepsilon_n = 3^{-n}$. We get C_i , u_i , E_i , σ_i and an orthonormal basis of $L^2(\mathbb{T}, d\sigma_i)$ such that

$$\sum_n \| \mathcal{K}_{\mathcal{E}_i}(e_{n,i}) \| < +\infty.$$

We set $\mathcal{H} = \bigoplus_{i \ge 1} L^2(\mathbb{T}, d\sigma_i)$ and let $K : \mathcal{H} \to X$ be defined by

$$\mathcal{K}(\oplus_i f_i) = \sum_i \alpha_i \mathcal{K}_{\mathcal{E}_i}(f_i)$$

where (α_i) satisfies (a) $\sum_i \alpha_i^2 \|E_i\|_{L^2(\mathbb{T},\sigma_i,X)}^2 < +\infty$, so that K is well-defined; (b) $\sum_i \alpha_i \sum_n \|K_{E_i}(e_{n,i})\|_X < +\infty$, so that K is γ -radonifying. Everything works with $R = KK^*$.

The correct statement

In fact, we have obtained the following statement:

Theorem

Let $T \in \mathfrak{L}(X)$ be such that, for any $D \subset \mathbb{T}$ countable, ker $(T - \lambda I; \lambda \in \mathbb{T} \setminus D)$ is a dense subset of X. Then there exists a Gaussian measure μ on X with full support, with respect to which T is a weakly-mixing measure-preserving transformation.

Example - Adjoints of multipliers

Definition

For $\phi \in H^{\infty}(\mathbb{D})$, the multiplier M_{ϕ} is defined by $M_{\phi}(f) = \phi f$, $f \in H^{2}(\mathbb{D})$.

Theorem

If ϕ is non-constant and $\phi(\mathbb{D}) \cap \mathbb{T} \neq \emptyset$, then there exists a Gaussian measure with full support on $H^2(\mathbb{D})$ with respect to which M_{ϕ}^* is a measure-preserving and weakly mixing transformation.

Adjoints of multipliers

Let k_z be the **reproducing kernel** at $z \in \mathbb{D}$:

$$orall f \in H^2(\mathbb{D}) \ : \ f(z) = \langle f, k_z
angle_{H^2}.$$

Adjoints of multipliers

Let k_z be the **reproducing kernel** at $z \in \mathbb{D}$:

$$orall f\in H^2(\mathbb{D})\ :\ f(z)=\langle f,k_z
angle_{H^2}\,.$$

 k_z is an eigenvector for M_{ϕ}^* .

$$\langle f, M_{\phi}^*(k_z) \rangle_{H^2} = \langle \phi f, k_z \rangle_{H^2} = \phi(z)f(z) = \langle f, \overline{\phi(z)}k_z \rangle_{H^2}.$$

Adjoints of multipliers

Let k_z be the **reproducing kernel** at $z \in \mathbb{D}$:

$$orall f\in H^2(\mathbb{D}) \ : \ f(z)=\langle f,k_z
angle_{H^2}\,.$$

 k_z is an eigenvector for M_{ϕ}^* .

$$\langle f, M_{\phi}^*(k_z) \rangle_{H^2} = \langle \phi f, k_z \rangle_{H^2} = \phi(z) f(z) = \langle f, \overline{\phi(z)} k_z \rangle_{H^2}.$$

When $\phi(\mathbb{D}) \cap \mathbb{T} \neq \emptyset$, one can find an open arc $I \subset \mathbb{T}$ and a curve $\Gamma \subset \mathbb{D}$ such that $\phi(\Gamma) = I$.

Adjoints of multipliers

Let k_z be the **reproducing kernel** at $z \in \mathbb{D}$:

$$orall f\in H^2(\mathbb{D}) \ : \ f(z)=\langle f,k_z
angle_{H^2}\,.$$

 k_z is an eigenvector for M_{ϕ}^* .

$$\langle f, M_{\phi}^*(k_z) \rangle_{H^2} = \langle \phi f, k_z \rangle_{H^2} = \phi(z)f(z) = \langle f, \overline{\phi(z)}k_z \rangle_{H^2}.$$

When $\phi(\mathbb{D}) \cap \mathbb{T} \neq \emptyset$, one can find an open arc $I \subset \mathbb{T}$ and a curve $\Gamma \subset \mathbb{D}$ such that $\phi(\Gamma) = I$.

$$E(e^{i\theta}) := \mathbf{1}_{I}(e^{i\theta})k_{\phi^{-1}(e^{i\theta})}.$$

is a (conjugate) T-eigenvector field.

How to find an ergodic measure

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Adjoints of multipliers

$$\mathsf{E}(e^{i heta}) := \mathbf{1}_{\mathsf{I}}(e^{i heta}) \mathsf{k}_{\phi^{-1}(e^{i heta})}.$$

is perfectly spanning.

Adjoints of multipliers

$$E(e^{i\theta}) := \mathbf{1}_I(e^{i\theta})k_{\phi^{-1}(e^{i\theta})}.$$

is perfectly spanning. Pick $f \in H^2(\mathbb{D})$ such that

$$\langle f, E(e^{i\theta}) \rangle = 0$$
 a.e.

Adjoints of multipliers

$$E(e^{i\theta}) := \mathbf{1}_I(e^{i\theta})k_{\phi^{-1}(e^{i\theta})}.$$

is perfectly spanning. Pick $f \in H^2(\mathbb{D})$ such that

$$\langle f, E(e^{i\theta}) \rangle = 0$$
 a.e.

$$f(z) = 0$$
 a.e. on Γ .

Adjoints of multipliers

$$E(e^{i\theta}) := \mathbf{1}_I(e^{i\theta})k_{\phi^{-1}(e^{i\theta})}.$$

is perfectly spanning. Pick $f \in H^2(\mathbb{D})$ such that

$$\langle f, E(e^{i\theta})\rangle = 0 \text{ a.e.}$$

$$f(z) = 0$$
 a.e. on Γ .

 $f \equiv 0.$

And so on...

- Many other examples (composition operators,...);
- Many other results (about the converse, on semigroups of operators,...)

Muchas gracias!
